Thus, whilst some benefits may be observable in the short term, it could be expected that as populations will continue to improve, then beneficial influences on yield and ecosystem service delivery, will continue to strengthen. The amount of land which can be spared will depend on field and farm size, but even a one metre strip between hedge and crop has been shown to benefit wildlife. For that reason, a balance must be found on-farms which allows for the needs of wildlife without impacting on the potential for food production.

This in turn serves to increase habitat opportunities and the diversity of flora. However, recent research has demonstrated that regardless of management approach i. These areas are often hiding in plain sight from the combine or tractor.

Can increasing wildlife populations benefit farm management? Ohio State University strategies such as vegetation buffer strips, both in-field and alongside water courses, may aid farmers in reducing the effects of diffuse pollution, limiting the impact to stream life, contributing to flood mitigation strategies and potentially improving the quality of drinking water.
