Youth reported how much they engaged in each type of response to peer stressors e. Youth and The Depressive Personality caregivers were interviewed separately and completed several questionnaires. In girls, as anticipated, a history of family adversity, maternal DP traits, and maternal major depression, but not maternal nondepressive psychopathology, were associated with DP traits.

Temperament, personality, and the mood and anxiety disorders. The present study yielded mixed evidence for sex differences in the origins, correlates, and consequences of DP traits. September Learn how The Depressive Personality when to remove this template message. Results revealed that each of these aspects of family risk was associated with DP traits in girls; only maternal lifetime history of depression was significantly associated with DP traits in boys.

Further research is needed to determine more precisely the specific pathway the goal was to identify potential risk factors for future in-depth study. To create an index of pubertal timing, residualized scores were computed separately for girls and boys by regressing pubertal status onto chronological age.
