All of the servers, however, are on a separate server VLAN. For an application to work, there has to be not only something to send information, but also something on the other end to listen. In these cases, it is best to break down the network into zones and deal with them separately.

So, when the backup router took over, it had to adopt the primary router's address. Or a dial backup type system might be unwilling to accept connections from remote sites unless they are manually authenticated, thus ensuring that this backup is not used to gain unauthorized access to the network. Should I route between switched areas or switch between routed areas? How to write a great review. Availability is not a useful metric in these cases. The questions he addresses in this book are need-specific:
