Security robot set to patrol L. Composite materials, like those used in carbon-fiber tennis rackets and golf clubs, have already done much to help bring weight down in aerospace designs without compromising strength.

With such mind-boggling materials at hand, building the better spacecrafts. Emerging from this intellectual gold-rush is a new class of materials with astounding properties that sound more at home in a science fiction novel than on the laboratory workbench. Today, scientists are able to grow tubes as long as Spaceships and Playoff Systems nanometers 20 cm. When materials can be designed on the molecular scale such holistic structures become possible. Notify me of new comments via email. This piezoelectric material, developed at NASA's Langley Research Center LaRC can "feel" deformations such as bending or surface pressure, producing a small voltage in response that can act as a signal for a central computer.
