Flow measurement - Wikipedia

Flow meters measure the volumetric flow rate in a pipeline. Most meters are based on deriving a signal from the fluid flow and calibrating the signal against the.

Introduction of more holes, e. Inevitably heat effects of welding cause distortions and other effects that prevent tabular data on discharge coefficients with respect to line size, beta ratio and operating Reynolds numbers from being collected and published.

With depth and a programmed cross-section this can then provide discharge flow measurement. Retrieved 14 March Another type is a variable area orifice, where a spring-loaded tapered plunger is deflected by flow through an orifice. Not to be confused with Optical-flow sensors.

The teeth on side B will now close off the fluid from entering side B. Radar devices can only measure surface velocities, whereas laser-based devices can measure velocities sub-surface. With depth and a programmed cross-section this can then provide discharge flow measurement.
